

## **TZI PassLock**

### **SCRIPTS**

main-server-for-testing.py

this file is for the main server where the user connect to when they open the app. this happens automatically. the version i gave you only works with the registration and login system so it is easier for you to work with

temp-server-for-testing.py

this is for the temporary servers where after the user logs in to interact with the app and their database. this is the full code.

client-end-for-testing.py

this is the app the user will use and be able to see their passwords, etc. the version i have given you only does the registration and login system so it easier for you to work with.

### **HERE'S WHAT I NEED**

i need you to create a simple website that includes the following:

1. a place where the user can pick their monthly or yearly plans.
2. when the user starts the checkout process, give an option to have the plan recur after the plan ends.
3. a place where the user can sign up and log in to view and cancel their plan(s) (more software will come in the future so make it easy to add different software and those plans to be added in)

i will also need a script in python that runs on a server that includes the following:

1. it gets an alert from the website, with the info about the software they chose and the length of the plan.
2. it will then generate a license key and input it into a new copy of the client-end app.
3. it will send an email to the client including the correct license key, and their copy of the software. make sure to in the checkout place require an email and make a note at the bottom saying this is where youll recieve your license key and your copy of the software.

**i'm going to create the temporary website to start with and then we can have a redirect link in the website to go to the store page that you make.**
